

I want to know why Verizon, Comcast, and so many other big-name companies are fighting the implementation of Wi-Fi when they are not even doing a good job of providing internet access to their current customers. Where I live, it is impossible to get high-speed internet access, unless you are willing to pay \$650 to have a special dish installed, and then pay a fee to the satellite company of \$59 per month. Why can't wireless access be implemented, when telephone and cable companies are not even willing to spend the money to offer service to remote areas such as the one I live in. We have four-way splitters on every telephone jack in our area. This makes our telephone service the next best thing to a party line. We have no cable, because it would not be economically viable for cable companies to offer service to remote areas. They don't even want our money, but they don't want anyone else to serve us either?
